

Each row pairs Method A (y-axis) against Method B (x-axis) for P (col 1), T (col 2), disequilibrium (col 3).
Axes fixed: P in (-5.0, 65.0) kbar, T in (600.0, 1900.0) C, DeltaP in (-25.0, 25.0) kbar, DeltaT in (-500.0, 500.0) C.
Disequilibrium box = +/- 2 sigma_conformal from nb07; in-box percent annotated per row. RMSE of disagreement with 95% bootstrap CI shown in each panel title.

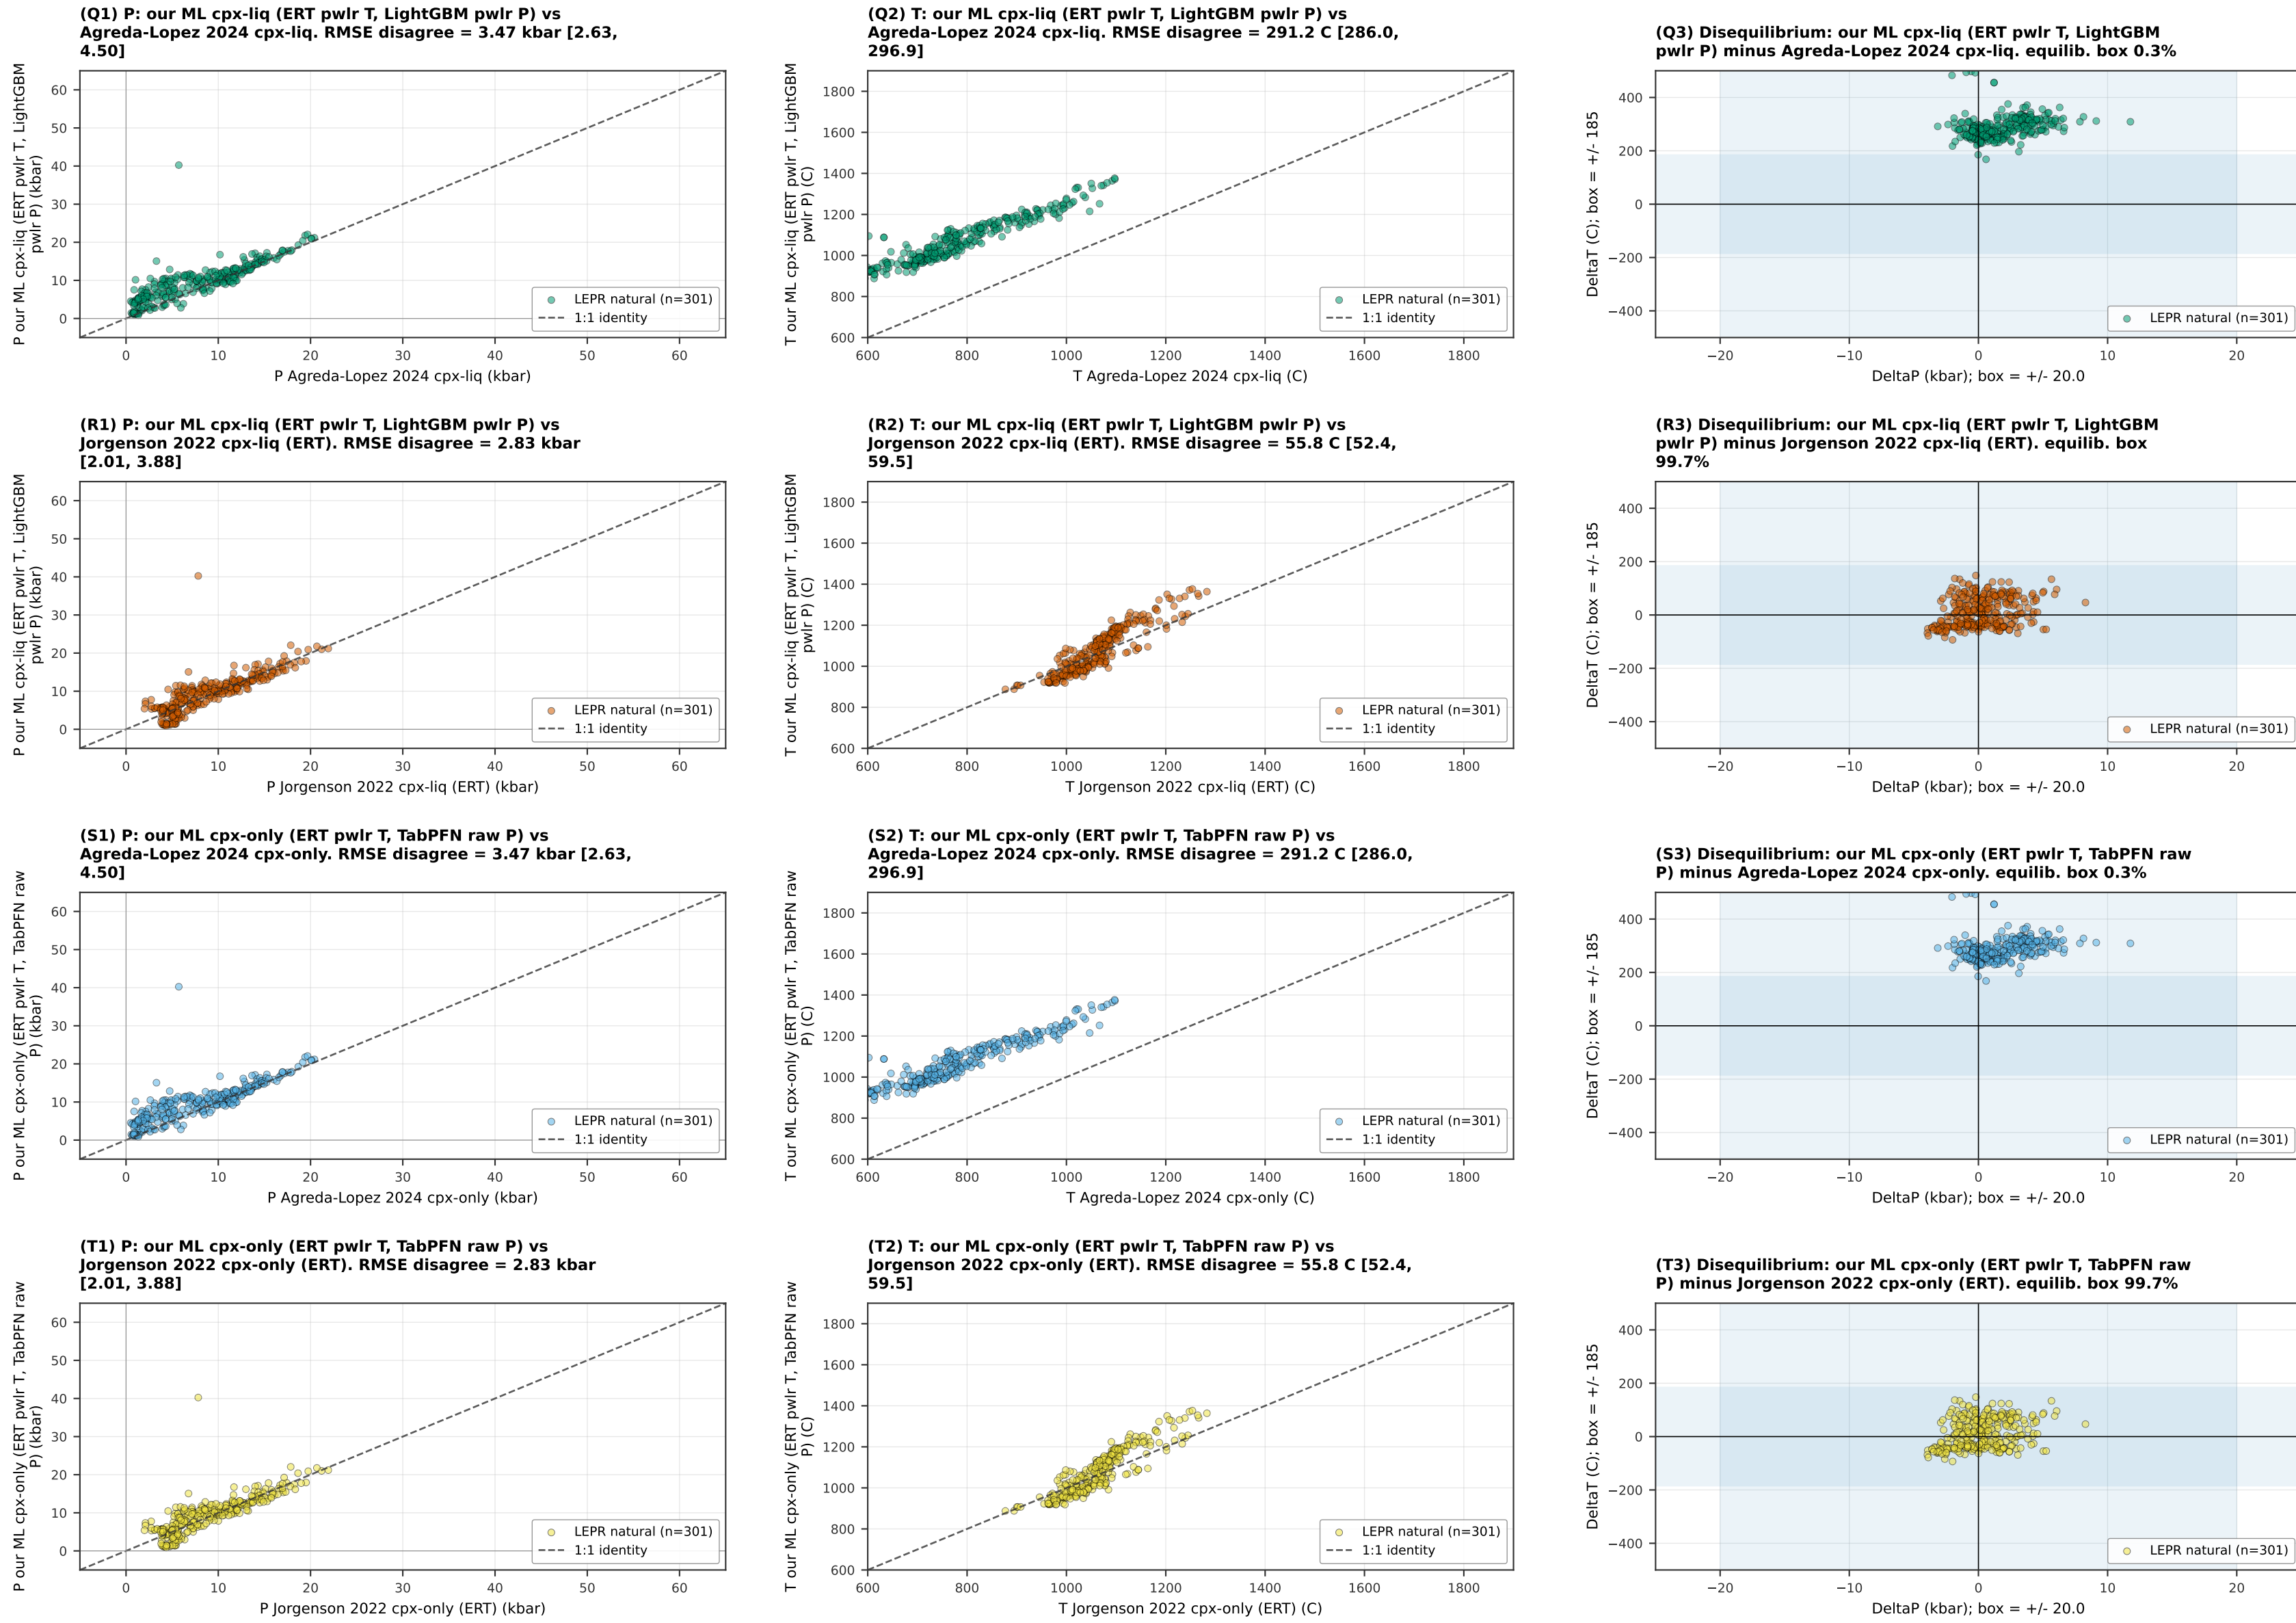

Section 1: cpx ML vs baseline regression models

Section 2: cpx ML vs our own machine learning models (cross-mineral; duplicated from Core_14a)

Section 3: cpx ML vs external machine learning models

Section 4: external ML vs external ML
